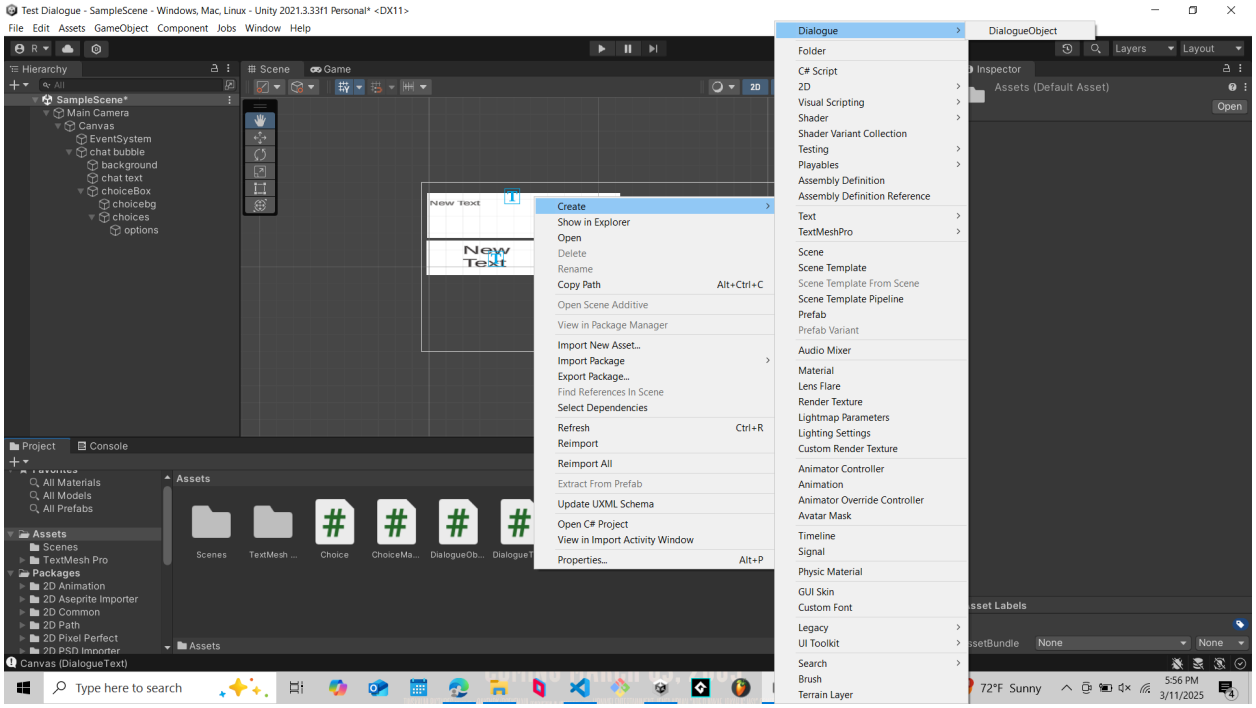
How to use the Dialogue System Scripts.

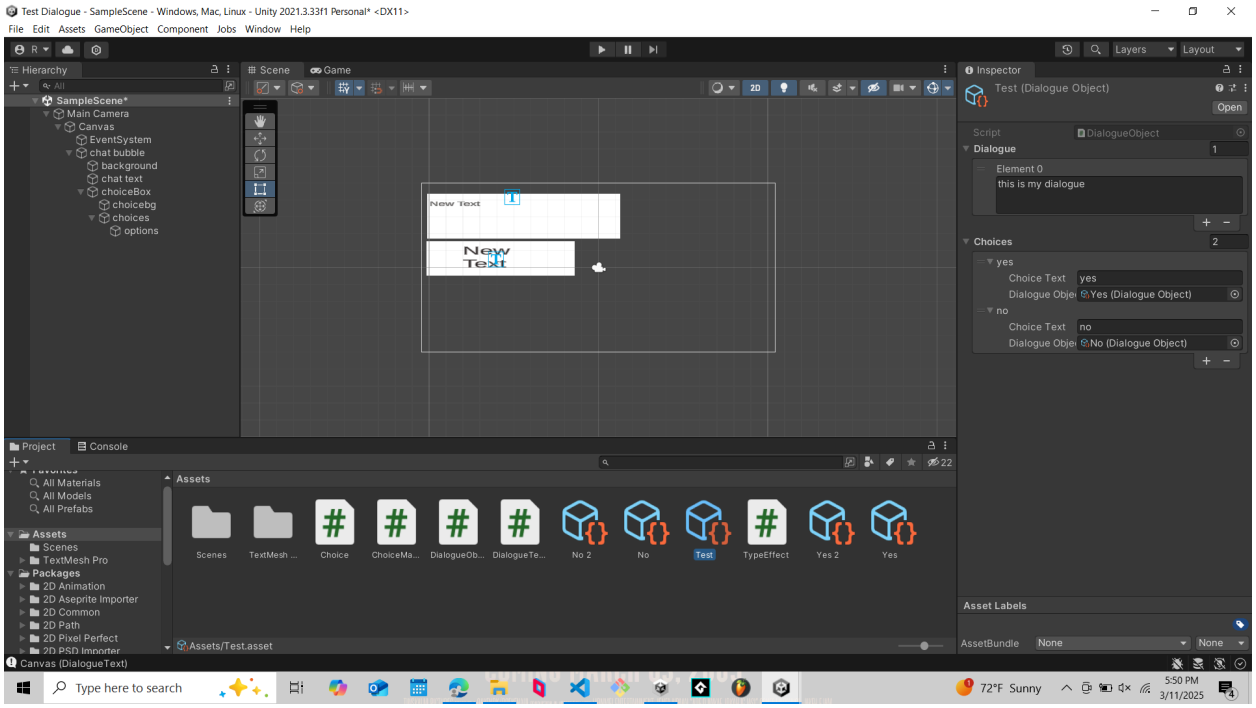
Step 1. Download Scripts from Github

There should be 5 scripts in total, those being: DialogueObject, DialogueText, Choice, ChoiceManager, and TypeEffect.

Step 2: Make a Scriptable Object.

To do this, right click on the assets tab, click create, then click dialogue, then click dialogueObject. In the object there should be 2 fields, one for the text called dialogue and one for your choices called “choices”. The choice section will have 2 fields, the top one being for the text that your button displays and the dialogue object the button points to so when it’s clicked, it goes to the next section of dialogue with its choices as well.



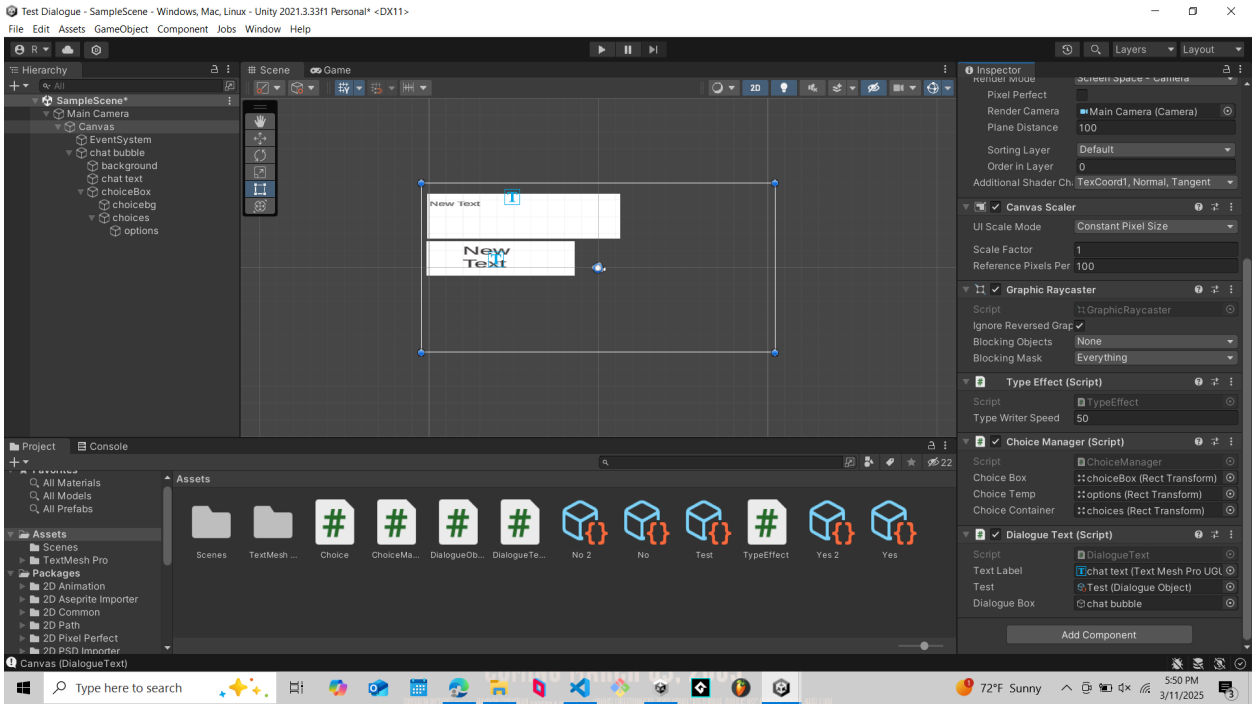


Step 3: Scene Setup

Copy what I have in the scene above. Some things to note though are within the options field(the text for your choices, add a button by going into the inspector and adding a button component. You'll also need to make sure that in your canvas, you have the Canvas Scaler and Graphics Raycaster added(should come automatically, if not you can add them manually through the add component button in the inspector).

Step 4: The Magic

Now your ready to really get started. First add the typeEffect, DialogueText, and ChoiceManager Scripts into the canvas. TypeEffect's purpose is just to display the words with a typewriter effect and its field lets you change how fast the letters display(it's set to 50 by default). DialogueText will have 3 fields. The first one is the text label which should be your textmeshpro(chat text) for the chat bubble. The dialogue box section is in the name, just drag the chat bubble object onto it. The test section is for the dialogueobject, so drag that into that field. ChoiceManager also has 3 fields. ChoiceBox is just the ChoiceBox object, ChoiceTemp is the textmeshpro(options), and choice container is the choices object which should contain options in the hierarchy like in the screenshot below.



Once all of that is setup, you can click play and begin. (Note that to start it, press the space bar. Currently when you select an option, when it moves to the next object you'll need to press the spacebar again to progress but that can be changed.)
